## Smell the Money – Not the Reclaim Reclaim Technology that Works

When you think about car wash reclaim systems, you probably think of terrible smelling wash water and dirty wash bays. Those days are over.

Reclaim technology has now arrived at odor free water with remarkable clarity. The technology is proven and easy – settling tanks, constant recirculation, ozone treatment, and boost clarifier – all done using on demand VFD pump output control, and self purging filtration for 5 micron product that is clean and odor free.

New Construction is a no brainer – you simply put the infrastructure in and use reclaim wherever your wash is located. With retrofits, things can get a bit more complex, however, the savings you'll realize from water use reduction and sewage/wastewater fee reduction makes it well worth the time, effort and money.

Clean, odor-free water with minimal operating expenses reduces water bills by 60% or more.

### *Why use a water reclamation system? Consider these factors ...*

***Reclaim Reduces water and sewer costs by 60% or more***

No matter where you are located, reclaim systems reduce water and sewer fees by 60% or more for an easy 3 year payback.

***Reclaim can offset Sewer Tap Fees saving tens of thousands of dollars for new construction washes***

Many new car wash sites pay sewer tap fees (water and sewer access charges) in the tens, or even hundreds of thousands of dollars. These access fees are special, one-time fees that are charged simply for the privilege of connecting to the municipal water and sewer systems. Impact fees can usually be dramatically reduced if the wash is designed with a water reclamation system. In many cases, the savings realized in discounted fees far outweigh the cost of the reclaim system.

***Reclaim Systems can offset poor city water pressure***

A water reclamation system can be used to supplement the water supply at sites with poor water pressure.

***Reclaim is Environmentally Friendly***

With proper management, a comprehensive water recovery program results in NO negative impact on the quality of the wash, produces no unpleasant odor, and provides enough recycled water to reduce fresh water consumption by 40% - 90%.
